Trading and non trading account

Photo Courtesy: Leo Patrizi/E+/Getty Images In today's digital age, having an email address is essential for everything from paying your utility bill online to signing up for streaming services to staying in touch with friends and loved ones. Emailing is one of the most commonly used forms of communication around the world, and having an email address streamlines a wide variety of tasks you might complete online. If you're ready to sign up for an email account, learn how to navigate the process, along with some helpful tips about picking an effective name and selecting the service provider that's right for you. Most people send emails today using webmail, which is any email service you can access from an internet browser — as opposed to downloading special email software onto your computer and having to run that program in order to get into your inbox. This is convenient because you can sign into your account and check your emails from just about any internet-connected device. There are quite a few different webmail clients out there, with some of the most popular and best-known including Gmail, Outlook/Hotmail, Mail.com and Yahoo! Mail. Photo Courtesy: Gareth Fuller/PA Images/Getty Images The first big decision you'll make when creating a new email account is selecting a provider. Although for the most part email clients serve the same general purpose — letting you send and receive digital mail — each provider's website, interface and features are slightly different. If you're more familiar with Microsoft's operating system and appearance, you may prefer Outlook, particularly because it's also available in the company's Office Suite, which you might use for work. Gmail, on the other hand, has a cleaner look and more organizational tools, and because so many people use it, it may be easier for you to chat with friends and family using this client. Take some time to review how each client works, what it looks like, whether it offers benefits such as cloud storage and how user-friendly it feels to you. Your local internet service provider (ISP) may also have its own email client you can use as long as you pay for the company's services. While it may seem convenient to opt for this, GCFGlobal recommends sticking with a free webmail provider instead of your ISP. The email interfaces ISPs use tend to be more complicated to navigate than webmail, and they often don't give you much storage space for your messages. If you need to move to a new area or you decide to switch to a different ISP, you'll lose all your old messages and contacts, which can be a major hassle if you have a lot of information sitting in your inbox. Stick with free webmail so you can always keep the same address. In general, the process of signing up for an email account is similar across the board for the popular webmail clients, and it only takes a few minutes. You'll start by visiting the client's website, such as Gmail.com or Outlook.com. Look for a button or link with text like "Create Account" or "Sign Up" that indicates it'll take you to the page where you can begin the process. Photo Courtesy: Microsoft Outlook On this next page, you'll add some personal information like your name, birthdate and location. You'll also choose the username you want, which is the portion of your address that appears before the "@gmail.com" or "@outlook.com" extension. It's important here to choose something that's evergreen, such as your name, if you're planning for this to be the main or only address you use. It should be a username that you'd be comfortable sharing with your boss, not a pun or something trendy you might find embarrassing later. If possible, try to make it something easy to remember and pronounce — think about how it sounds spoken aloud for those times when you tell someone your address. After this, you'll select a password. Depending on the client you choose you might also need to enter your phone number for verification purposes. After accepting the site's terms and conditions and its privacy policy, your new account will be ready. You can sign into your inbox by visiting your webmail provider's homepage and looking for the fields where you enter your username and password. Now that you have your own digital mailbox, it's helpful to know a few tips about keeping your account information secure. After all, you might start using your email address for services like online banking or communication with medical providers, and you don't want any personal information like other account names and passwords to end up in the hands of a hacker or someone else who might misuse or exploit it. Photo Courtesy: gradyreese/E+/Getty Images One of the easiest yet most effective things you can do to secure your account is to use a unique and strong password. This means it should be a password you don't use on any other sites, and it should be somewhat complicated — something other people can't guess about you, like your birthdate, name or other personal information. It should be on the longer end; don't use something with only one word and a few numbers, like "password123." Instead, consider choosing a meaningful phrase like song lyrics or an abbreviation using the first letter of each word in a sentence. Another way to secure your address is to set up two-factor authentication if your provider allows it. This process involves completing two separate steps to access your inbox. For example, you'll type in your password on your inbox homepage as the first step. Then you might receive a text message on your phone with a code you need to type into your email provider's website before you can get into your emails. This helps the website know that it's really you accessing your account because you had to both know your password and have your smartphone nearby to get into your inbox. Forex trading sounds like an exciting financial opportunity to those who hear about it for the first time. The possibility of trading large sums of leveraged money sparks the imagination, but most who find the prospects of this market attractive will soon find they are surrounded by online hype and hyperbole. The reality of trading is quite different from the sales pitches most people hear. That's because it is hard to be consistently profitable and most traders lose money in the early stages of their experience. What is not hard, however, is actually opening a brokerage account. Choosing a brokerage is more meaningful if a beginner has actually tried out several different forex demo accounts. The first thing you'll do is set up an account with a forex broker. You'll need to provide a good deal of personal information to get your account set up, including the following: Name Address Email Phone number Account currency type A password for your trading account Date of birth Country of citizenship Social Security Number or Tax ID Employment status You will also need to answer a few financial questions, such as: Annual income Net worth Trading experience Trading objectives You might wonder why forex brokers want to know all of this information. The simple answer is to comply with the law. The environment surrounding forex trading has a comparatively low degree of regulation, but in recent years, more regulations have been put in place to provide some degree of protection or assurance to account holders. Additionally, forex brokers need to ask these questions to protect themselves from the risk of loss. They want to make sure customers who overleverage themselves will still be able to pay back any unexpected losses. It's unlikely that you will find any broker willing to open your trading account without requiring these questions to be answered. If you do happen to find one that isn't asking many questions, you should be suspicious. If you are ever feeling wary about a particular broker, you can look them up through the National Futures Association to find out their status. During the final steps of opening your account, you will see risk disclosures. Please take these seriously. Forex is a difficult business for beginners. It tends to eat them for dinner if they aren't careful. There are more losers than winners on average. The broker is required to remind you of the forex risks. Once you've turned in all of your information to be processed, the broker will verify it and typically ask you to send in some verification documents such as a government-issued ID, and maybe a utility statement to verify your name and address. The back and forth process can slow down the process by a day or two, but it's nothing to concern you. Once your information is verified, you can fund your account and begin trading. One common piece of advice for new traders is not to put any money into a trading account that you cannot afford to lose. It seems like obvious advice, but some people start off feeling like they know more than they do, and take unnecessary risks. Start with a fair amount of money and trade small. Nothing can prepare you for the emotions that you feel when your money is truly at risk, so go slow in the beginning. Forex seems very exciting, but in reality, it should be boring and cut and dried. If you feel a great deal of anxiety when making trades, be careful. It's common to either get too wound up from your winning trades or become a destructive trader from your losing trades. Learning to make trades using research and systematic logic will serve you much more than relying on emotion to guide your trading. Forex should feel like simple, methodical decision-making with precautionary steps in case of failure. While that might sound boring to you, you will survive much longer if you approach that market that way. If you find yourself feeling like you are making common forex mistakes and just generally feeling frustrated, stop trading, and review the basics again. Forex trading is one of those industries where occasionally you have to re-evaluate your methods to make sure you are achieving your goals. Try not to get too frustrated and keep your approach scientific and unemotional. trading and non trading account from incomplete records. difference between trading and non trading account. what is the difference between trading and non trading
