By Erik Devaney | George Doyle & Ciaran Griffin / StockByte / Getty Images A subscriber identification module, or SIM, the card is a removable memory chip that stores information about the mobile phone account account. This information can include call records, contact lists and text messages sent and received. While the SIM cards can upgrade to new phones and switch to different simpler phones processes, the cards can also cause problems. This is particularly relevant when it comes to Apple's iPhone smartphone line, which have significantly suffered from SIM card problems in the past. In some cases, an iPhone can display the message "No SIM installed" after switching on the phone. Finish © This message appears, the iPhone will not be able to work. To remedy this problem, Apple recommends removing the SIM card first, which you can press by pressing the end of a clip or a SIM ejector tool, in the hole on the iPhone SIM card tray. After the tray opens and removes the card, reinsert the card and tray and turn off the phone. When you turn on the iPhone, it will ideally detect the SIM card within two minutes and the phone will work properly. If the iPhone is still able to detect the SIM card, it may be due to the fact that the SIM card is dirty or damaged. If an iPhone is able to recognize an alternative SIM card, but not the card with which the phone has arrived, this is an indication that the original iPhone SIM card is dirty or damaged. To clean a dirty SIM card, it is possible to slightly rub golden paper contacts with a rubber rubber. Alternatively, contacts can be cleaned with a specialized pen for cleaning the circuit, which you can find in electronics stores. If a SIM card still does not work in an iPhone after cleaning, it is likely that the SIM card is damaged and requires replacement. Crepe and scratches on the SIM card are other more visible indicators of damage. If you find that the SIM card of an iPhone is damaged or that an iPhone is unable to read a "healthy" SIM card, you will probably want to send that iPhone to Apple for repair work. Before sending an iPhone, make backup of all phone data and then delete the contents and phone settings. You can run what you select settings, then General, then restore and finally delete all the contents and settings. While some problems with the SIM card in iPhone are not preventable, there are some preventive measures that you can undertake to ensure that a SIM card does not become dirty or damaged. For example, you should always treat your iPhone gently; Don't throw it on a table or a surface and not take for granted that a friend will take him if we took it to him. Also, if an iPhone works properly and you don't upgrade or switching the phones, you don't need to remove the SIM card. The removal of the paper will explain to the elements, adding to the risk of problems. By Mely Parker | John Moore / Getty Images NovitÁ / Getty Images Your iPhone has the same reset process if you use a SIM card or is designed for CDMA networks. Although no SIM card is in the device, you can normally restore the iOS software: The apps and functions that require the mobile service do not work until the SIM card is not on the phone, but the iOS software will still work normally. Add a SIM card before or after restoring the iPhone to connect to your provider's network. Restore the phone in iTunes Returns your apps, supports and personal information on the device Once the new iOS copy is installed. Before Start the restoration process, back up your iPhone with iTunes so that the most recent data and settings can be saved on your iPhone after the reset is completed. Press the release button on the micro-sim slot with a Paperclip or SIM tool and then insert the SIM card, if you have one. If you don't, continue without putting a SIM card in your iPhone. Connect your iPhone into your computer with the iPhone charging cable. Start iTunes on your computer. Click on "iPhone" in the Tab and then click the "Summary" tab. Click "Restore iPhone" and then click "Restore". Wait for the device to restart. Drag the cursor on the screen and follow the steps to configure your iPhone. By John Lister | Daniel Barry / Getty Images News / Getty Images Each iPhone contains a slot for a SIM card. This tab is an integrated circuit that connects the receiver for a user's account with a service provider, along with the phone number connected to that account. iPhone turning on AT & T will need a SIM card to connect to the telephone network, but iPhone running on Sprint or Verizon do not need a SIM card to operate. In theory, the SIM cards are interchangeable, but in reality there are different physical and technical limitations on this capacity. Many iPhones are "locked" for a particular network, in the sense that it cannot work with a SIM card provided by a rival network. Locking is normal in any iPhone sold at a price discounted by the network and accompanied by a service plan. Apple sells iPhone unlocked at full, subsidized prices. Whether you can "unlock" a laptop, when you can do so, and whatever you will cost you, it depends on both the network and the contract. In a surprise exception for this usual practice, iPhone 5 receivers shipped to Customers from Verizon are unlocked. This means that these phones will be run on AT & T if a SIM card AT & T is inserted. Taking advantage of this feature does not replace any minimum contract duration on a Verizon deal: you must still pay your monthly charge, while under contract. Even if you use a different network. To avoid this monthly fee, you can cancel the contract, but it is possible that an early resolution cost may be charged. Even if you have an unlocked iPhone, you will not necessarily be able to use it with any SIM card. This is because different phones use one of the two main technologies for voice calls: GSM or CDMA. Many networks offer a service using only one of these technologies: Verizon and Sprint CDMA use, while AT & T and T-Mobile use GSM usage. Your iPhone will not be able to get a voice connection on a network using the "wrong" technology, regardless of the SIM in use. Networks generally use compatible technologies for 3G and 4G data transmission. This means, for example, that an iPhone Verizon 5 with an AT & T SIM can access AT & T 4G services at high speed. Different iPhone models use different SIM cards in size. Those who up to 3GS take a traditional SIM card used in most mobile phones. 4 and 4S Use a smaller micro-sim card while the 5 use a small and more subtle nano-SIM card. It is possible to reduce a full-sized SIM card for use in an iPhone 4 or 4S removing part of the SIM card that does not contain any data. Some users have reported the cut successfully down to a standard SIM card to use in an iPhone 5, even if the results can be variable due to the most subtle frame of the nano-paper. Before using SIM card of a different network in your iPhone, consider how and where you intend to use. Your network choice can affect whether it is possible to get cover abroad and in what speed. It can also influence if it is possible to use voice and data services simultaneously, for example, be able to control a website while making a phone call. Each iPhone has a SIM card slot on the right side. The slot hosts a tray that contains your iPhone's sim card. That SIM card allows you to connect your mobile phone to your operator so that you can do and get mobile data. You might ever need to access the SIM card, if you have purchased the iPhone with a pre-installed from the support. However, if you buy a unlocked and sim-free phone, or buy used, you're King going need to have familiarity with what a SIM card is, and how to exchange one out. Fortunately, access to an iPhone's sim paper tray is not complicated, but you will need three things before you start. An iPhone (obviously) the SIM card you want to install a tool to hit in the side of your iPhone to expel the sim tray the final one can be a bit difficult. According to whatever You may be a removal tool of the SIM card in the box. If there is, you're good to go. If not, they're stupid-cheap on Amazon, but you can also use an unfolded paperclip, a needle, or anything else that is thin, pointed. Try not to stab yourself as you go. Once obtained the SIM card removal tool (or a proxy), poke into the small hole that is part of the SIM drawer. You should feel a resistance, and you have to push it a bit. If this is the first time doing this, you might feel a bit 'strange, but you do need to exercise a bit' of strength to get the tray. Once you do, the tray will start to excrete, and all you need to get to that point pulls the rest of the way out. Once the tray is out, remove any existing SIM card and install the new one. Make sure you have the correct way using the notched corners as a guide. Once installed the card in the tray, reinsert the complex in your iPhone, ensuring that the pin hole is lines up with the hole in the phone as you do. After completing the installation of the paper, it should be recognized by your iPhone without any restart device. Otherwise, try to turn on and off Airplane mode or restart the iPhone completely. This should prepare and run well. All iPhone and iPad mobile phones are equipped with slot with SIM cards on their sides. A SIM (Subscriber Identity Module) card is like your carrier provides all the information on your device needs to get their voice services and data related to your network account and access. If you travel internationally, or planning to change carriers, you may need to swap the SIM card in your iPhone or iPad. If you upgrade, you want to use a local SIM card while traveling, or you want to remove the SIM card on your iPhone or iPad for whatever reason, that's how! What you need Where the SIM tray is situated How to remove the SIM card What you need to remove the SIM card in your iPhone or iPad The only thing you need to remove the SIM card in your iPhone or iPad is a SIM card Apple removal Tool (included in the package in some countries, especially when you buy an unlocked device) or a small clip bent paper clip. If you are using a paper clip, straighten the long ends as long as © does not occur (see photo above). If you're using something different, like the tip of a small screwdriver, just make sure it fits into the SIM slot eject. You do not want mangolare your device. Find where your SIM tray on your iPhone or iPad model almost all the iPhone come with a SIM card tray \*. If you have an iPhone 4S or new, have one SIM card slots. \* The only exception has been the CDMA version of the iPhone 4. Here's where you can find, given your iPhone model: Original iPhone / iPhone 3G / iPhone 3GS: On the top of the iPhone including the headphone jack and iPhone 4s power button and after: on the right side of the iPhone, on the opposite side of the switching buttons and mute the volume Only iPads with cellular capabilities have SIM trays. If you have one, here's where you can find your SIM tray: Original iPad: Along the left side of the iPad into the center, opposite the side that contains the switch buttons and mute the volume near the bottom of iPad 2 / 3/4: Along the left side of the iPad, opposite to the side that contains the switching buttons and the volume mute, near the top iPad Pro / Air / Air2 / mini (all generations): on the lower right side of iPad , on the same side that contains the switching buttons and mute the volume gently insert the small paperclip is folded earlier in the small opening In the sim tray. Apply a small amount of pressure until the SIM tray opens on the iPhone or iPad. Do not apply the pressure on a corner, only in the direction of the pin hole. Take the SIM tray grip and pull out. Exchange your SIM card. Make sure you have the SIM installed in the correct orientation by aligning the serrated angles on the card. Reinsert the tray. Make sure you enter the SIM tray in the correct orientation. Note: if you are six An iPhone XS, iPhone XS Max or iPhone XR from continental China with two Nano-SIM cards, the cards are positioned on both sides of the SIM tray and should only adapt to a way. Keep in mind that you should never force a sim tray in place. You can break the pins out of the logic board and that can leave your iPhone or iPad impossible to connect to any cellular network. Always make sure the sim is installed correctly in the tray and you are reporting it to your iPhone or iPad in the correct direction. An easy way to be sure is to align the pin hole. In this way you know you're putting it properly. Requests? Let us know in the comments below!
