# Smooth muscle tissue diagram

How to identify smooth muscle tissue. Smooth muscle tissue diagram labeled.

There are three types of muscle tissues in the body: skeletal muscle, heart muscle and smooth muscles. We each discuss it. The skeletal muscle is also known as a volunteer muscle because we can consciously or voluntarily control it in response to the entrance from nerve cells. The skeletal muscle, together with the cardiac muscle, is also indicated as striata ("strips") because it has a microscopically striped or striped appearance. The skeletal muscle and its associated connective tissue comprise about 40% of our weight. You may want to write the following words about your pillowcase: skeletal, striated and voluntary. Perhaps doing these three words in your mind permanently. More probably, however, it's that your landlord will make you replace the pillowcase. The muscle heart muscle was found only in the heart, and although he is striated as skeletal muscle, works unintentionally. The hard and smooth muscles are autanmic, are able to contract spontaneously without nervous or hormonal stimulation. The heart contracts or beats about 100,000 times a day, 36 million times a year and about 2.5 billion times over a lifetime. In a single day our blood travels about 12,000 miles-four times the distance through the United States from the coast to the coast - and in the course of our lives, our heart pumps about 3 super blood filled. Don't give up your brain trying to memorize these numbers. The goal is to appreciate the ability of this incredible organ. You may want to write these words on the other side of your pillowcase: cardiac, striata and involuntary. No damage done now: you have already ruined your pillowcase anyway. The smooth muscle of the muscle is widely distributed throughout the body, which is located in the walls of cables such as our digestive, reproductive and urinary tracts, pipes such as blood vessels and airways, and in other places, like the interior of the 'eye'. Gets the name because missing the striped appearance that skeletal and cardiac muscle shows microscopically. Together with the cardiac muscle, the smooth muscle is involuntary, not under our conscious control. The smooth muscle is sometimes known as a visceral muscle because it is an important component of many internal organs (visceral). You may want to borrow the pillow of your roommate and write visceral, urbanized and involuntary on it. Your roommate will disprise you, but can help you remember the smooth muscle. You can always get a new roommate. \*\* You can use the keys below to go to the next or previous reading in this basic module of the organic present fabric in muscle animals tissue the body contains three types of muscle tissue: (a) skeletal muscle, (b) musculature Smooth, and (c) of the cardiac muscle. It is also indicated as myopropulsive fabric. Muscular tissue is formed during embryonic development, in a process known as Miogenesis. The muscular tissue contains protein à €
