grid/hierarchical-grid-types-and-load-modes/nestedview-template This feature of RadGrid gives you the freedom to design the overall structure and appearance of detail tables in hierarchical grid. In addition, the nested view template can be data bound to a single record from a data source object by setting the NestedViewSettings.DataSourceID property of the grid table view and defining a relation to the parent level through the NestedViewSettings.ParentTableRelation property of the same table view. Download free 30-day trial This method takes control id for an argument and returns the corresponding client object of RadControl or ASP.NET AJAX control inside the grid row. function HierarchyExpanding(sender, args) { var ROWNUM = args.GetDataKeyValue("ROWNUM"); \$.ajax({ type: "POST", contentType: "application/json; charset=utf-8", url: "WebServices/GetData.aspx/getCountToParentize", data: "{ 'ROWNUM': " + ROWNUM + " }", dataType: "json", async: false, success: function (data) { var count = data[0].ROWNUM; How update Tab:Text from here ?????? ; Aerror: function (request, status, error) { } });
