You can further reach us through our social sites like Facebook & and Twitter Sophia Louis is a blogger and professional SEO expert. You love writing blogs and articles related to Android & iOS phones. She is the founder of Android-ios-Data-Recovery and always sees an anxious about solving problems related to Android and iOS devices, my son accidentally pressed the factory reset button on my Android phone. Now, all the data disappeared. How to recover data from the Android phone after a factory reset? Is there any way? Yes! There are more ways to retrieve data after resetting the Android phone factory. It doesn't matter if the factory reset has been accidental or intentional, you can always get your data easily. In this article, we mentioned some ways to retrieve phone data after a factory reset and you can use one of the following ways and get your data back. Why did the factory restore your Android phone? Before talking to you about the best way to recover data after resetting the factory of your Android, let you talk to you for the first requirement to reset the factory of your Android. Reason 1: Get rid of the garbage Our SD cards in Android phones and the internal storage of our phone are always packaged with quite some extra data of those we actually know, and this is the reason behind the storage space that He did so quickly. Most data is garbage, and is useless for you. Factory reset Your Android cleans the entire trash and offers you an additional free space to store data. Reason 2: Get rid of malicious files Your SD card may already store a handful of malicious files and data with a long use. These files can corrupt your data or damage your device. These files can contain malware, bugs, viruses, etc. And they can threaten your device's health and privacy of your data. Factory restoration Your Android can delete all these hidden hidden files. Reason 3: Clean the entire data when buying a new SD card, it is important before restoring the factory via your Android phone before starting to use it. This will delete all unnecessary data or malicious files. The same is true when you are selling your SD card or your Android phone. You need to restore the Android phone factory to delete all the data stored in this before selling it to anyone. This will ever any possibility of using your data. Note: It doesn't matter because you are planning to restore the factory of your Android, it is always advisable to back up all your important data before you restore the Android phone. Is it possible to recover all the data after making the factory reset on Android? Yes! It is absolutely possible to recover the data after the Android factory reset. Like? Because whenever you delete a file from your Android phone or from your factory reset, your Android phone, the data stored on the phone are never permanently deleted. The data remains hidden in the storage space of your Android phone. Only data overwrite can then lead to permanent deletion of the data. If you accidentally restore your Android phone or do you intentionally, there are still very high possibilities that you can successfully recover the data after restoring the Android factory. But to do it, you'll need a powerful Recovery of Android data can scan your device and retrieve all data after the factory resets your Android. How to recover data after restoring the Android phone factory? It is not necessary to panic of this problem, because in this part, you will learn 2 more effective methods to restore data after resetting the Android phone. Let's begin. Method 1. Recover from local backup Most Android devices are equipped with a built-in backup functionality. So if you back up using that function on your Android device, you will be able to restore your data from that backup after the factory factory Your Android device. The process to back up your Android phone and restore Android data after a factory reset is almost identical to all Android phones there outside. Step 1. Backup of data Switch to the "settings" in your app and go to the "Backup and Restore" section. LA You will see a backup option to back up Android phone data. Enable the option and complete the requested process from your Android phone. Step 2. Restore data to retrieve data after the Android factory reset, go to the "Backup and Restore" section in "Settings". Now, look for the "Restore" option and choose the backup file you created before resetting your Android phone. Select the file and restore all your data. Note: After creating a backup file after "Step 1", you will be asked to transfer the file to another device during the factory reset of your Android. Once the Android factory restoration is complete, you can transfer it to your Android to restore data after resetting your Android's factory. Method 2. Recuperator from the Google account You can also use the Google account connected to the device to back up data and restore data after the factory resets your Android. Step 1. Backup of data Switch to the "settings" on the device and access the "Google" option. Once inside, go to the "backup". Here, you will see the options to back up automatic data to the Google connected account and a backup option now. Enable both options. Also, enable the "Auto Restore" option. Allow the backup process to finish. Step 2. Restores your data now, when you set up your Google account on the device after reset it at the factory, you get an option to restore data during the configuration process. I accept, and all your data will be restored to the device. Method 2. Recover data with the recovery of Android DR.FFO data as we have seen, deleted files can still be recovered from the device with the help of a specialized tool designed for this particular reason. One of the best Android Data Recovery software Dr.Fone - Data Recovery (Android) can easily help you recover data from any Android device very easily as we will see soon. Download |, Vnci Download |, Mac Step 1. Connect your Android phone starts Dr.Fone to your computer and select "Recovery data". Connect your Android phone to your computer using a USB cable. Make sure you have enabled USB debugging on your Android phone. When the device is detected, you will see the screen as follows. Step 2. Select file types to scan after the phone is connected correctly, Dr.Fone for Android will display all types of data that supports recover. By default, checked all file types. You can simply select the type of data you want to recover. Then click "Next" to continue the data recovery process. The program will analyze your device first. After that, you will continue to scan your Android phone to recover deleted data. This process will take a few minutes. Be patient. The precious things always is worth waiting. Step 3. Preview and retrieve deleted data on Android devices when scanning is complete, you can preview the data found one by one. Check the elements you want and click on "Recover" to save them all on your computer. You may also be interested in: In:
