String array in php

Generic search string to find PHP Developers Build a search according to your needs: -job -jobs -sample -examples, to avoid irrelevant results (intitle:resume OR intitle:cv), to discover candidates' online resumes or CVs ("PHP developer" OR "PHP programmer") to cover variations of the same job title Here's an example of a generic search string that you can further modify to find talented candidates: (intitle:resume OR intitle:cv) ("PHP developer" OR "PHP programmer") -job -jobs -sample -examples When running this command using Google, you will get results that include the words "resume" or "CV" in the page title. Adding variations of developer job titles provides more relevant results. And, excluding more terms reduces false positives. Searching for profiles of PHP Developers Search for PHP Developers on specific sites through Google by including the site: operator and terms found exclusively on member profiles. For example: site:meetup.com "member since" "PHP developer" site:github.com "joined on" "PHP developer" Add more criteria to your Boolean search string for PHP developers to find profiles that better match your requirements. When sourcing EU candidates, please refer to guidance on using social media for recruiting and collecting candidate information as per the General Data Protection Regulation, or GDPR. Sample string to search for resumes of a PHP Developer in various formats (intitle:resume OR intitle:cv) (filetype:pdf OR filetype:doc OR filetype:txt) ("PHP developer" OR "PHP programmer") -job -jobs -sample -templates Examples of Boolean search strings to find PHP Developers by experience and skills Boolean strings for PHP developers who: Are familiar with HTML5 and CSS3 (intitle:resume OR intitle:cv) ("PHP developer" OR "PHP programmer") (HTML5 OR CSS3) -job -jobs -sample -examples Know MongoDB and MySQL (intitle:resume OR intitle:cv) ("PHP developer" OR "PHP programmer") (MongoDB OR MySQL) -job -jobs -sample -examples Are familiar with coding standards (intitle:resume OR intitle:cv) ("PHP developer" OR "PHP programmer") (PEAR OR PSR) -job -jobs -sample -examples Can code in C++ and JavaScript (intitle:resume OR intitle:cv) ("PHP developer" OR "PHP programmer") (JavaScript OR C++) -job -jobs -sample -examples Know a certain version of PHP (intitle:resume OR intitle:cv) ("PHP developer" OR "PHP programmer") PHP5 -job -jobs -sample -examples Have experience with open source content management frameworks (intitle:resume OR intitle:cv) ("PHP developer" OR "PHP programmer") (Drupal OR Joomla) -job -jobs -sample -examples Have used the Scrum methodology (intitle:resume OR intitle:cv) ("PHP developer" OR "PHP programmer") Scrum -job -jobs -sample -examples Examples of Boolean search strings to find PHP Developers by location By state or city: (intitle:resume OR intitle:cv) ("PHP developer" OR "PHP programmer") ("New York" OR NY) -job -jobs -sample -examples (intitle:resume OR intitle:cv) ("PHP developer" OR "PHP programmer") "Los Angeles" (California OR CA) -job -jobs -sample -examples By area code: (intitle:resume OR intitle:cv) ("PHP developer" OR "PHP programmer") ("New York" OR NY) (718 OR 929) -job -jobs -sample -templates Find area codes here. An array in PHP computer programming contains a group of similar objects that are the same type and size. The array can contain integers, characters, or anything else with a defined data type. The print_r PHP function is used to return an array in a human readable form. It is written as: print_r(\$your_array) In this example, an array is defined and printed. The tag indicates the following code is preformatted text. This tag causes the text to be displayed in a fixed-width font. It preserves line breaks and spaces, making it easier for the human observer to read. When the code is run, the results looks like this: Array([a => Angela[b] => Bradley[c] => Array([0] => Cade[1] => Caleb)) You can store the result of print_r in a variable with a second parameter to print_r. This technique prevents any output from the function. Augment the function of print_r with var_dump and var_export to show protected and private properties of the objects, including type and value. The difference of the two is that var_export returns valid PHP code, whereas var_dump does not. PHP is a server-side language used to add enhanced features to a website developed in HTML, such as surveys, shopping carts, login boxes, and CAPTCHA codes. You can use it to build an online community, integrate Facebook with your website, and generate PDF files. With PHP's file-handling functions, you can create photo galleries and you can use the GD library included with PHP to generate thumbnail images, add watermarks, and resize and crop images. If you host banner ads on your website, PHP rotates them at random. The same feature can be used to rotate quotations. It is easy to set up page redirects using PHP and if you are wondering how often your visitors check out your website, use PHP to set up a counter. PHP is a popular server-side scripting language for the web. It's used all over the internet and is mentioned in lots of web page tutorials and programming guides. Generally speaking, PHP is used to add a functionality to websites that HTML alone can't achieve, but what does that really mean? Why is PHP used so often and what benefits could you get out of using PHP? Note: If you're new to PHP, hopefully everything we discuss below gives you a taste of the types of features this dynamic language can bring to your website. If you want to learn PHP, start with a beginners tutorial. PHP can perform all types of calculations, from figuring out what day it is or what day of the week March 18, 2046, falls on, to performing all types of mathematical equations. In PHP, math expressions are made up of operators and operands. Basic math addition, subtraction, multiplication, and division are done using mathematical operators. The large number of math functions are part of the PHP core. No installation is required to use them. PHP also lets users interact directly with the script. This can be something really simple, like collecting a temperature value that the user wants to convert from degrees to another format. Or, it can be much more extensive, like adding their information to an address book, letting them post on a forum, or participate in a survey. PHP is particularly good at interacting with MySQL databases, which opens endless possibilities. You can write user-submitted information to a database as well as retrieve information from the database. This allows you to create pages on the fly using the contents of the database. You can even perform complex tasks like setting up a login system, create a website search feature, or keep your store's product catalog and inventory online. You can also use PHP and MySQL to set up an automated picture gallery to showcase products. Use the GD Library that comes bundled with PHP to create simple graphics on the fly or to edit existing graphics. You might want to resize images, rotate them, change them to grayscale, or make thumbnails of them. Practical applications allow users to edit their avatars or generate CAPTCHA verifications. You can also create dynamic graphics that are always changing, such as dynamic Twitter signatures. Cookies are used to identify a user and store the user's preferences as given on the site so the information doesn't have to be re-entered each time the user visits the site. The cookie is a small file embedded on the user's computer. PHP lets you create, modify, and delete cookies as well as retrieve cookie values. For the past decade, visitors on one of Costa Rica's 50-plus "canopy tours" have enjoyed a bird's-eye view of the tropics by zipping across cables that run through the trees. But thanks to the enterprising actions of Canadian transplant Darren Hreniuk, the popular adventure attractions in trouble: in April, Costa Rica's National Registry began enforcing Hreniuk's claim as the sole patent holder to all canopy operations in the country. Hreniuk, operator of the Original Canopy Tour based at the Monteverde Cloud Forest Lodge, maintains he created the first zipline tour in 1994. He didn't patent the idea until three years later, however, after other tours had entered the country. Most operators have scoffed at the patent, noting that zipline technology has been in use recreationally since the seventies. But empowered by the registry's order, Hreniuk has attempted (with temporary success) to shut down his competitors and confiscate their equipment. In response, they have jointly appealed the patent, forcing the constitutional chamber of Costa Rica's Supreme Court to suspend the closures pending further study. "We have nothing against Hreniuk," says the canopy group's lawyer, Alvaro Carazo, adding that he blames the situation on the ignorance and incompetence of the patent officials. But until the high court hands down its final verdict, the fate of these canopy tours is left dangling in the trees. Self-referentially short for PHP, Hypertext Preprocessor, an open source, server-side, HTML embedded scripting language used to create dynamic Web pages. In an HTML document, PHP script (similar syntax to that of Perl or C) is enclosed within special PHP tags. Because PHP is embedded within tags, the author can jump between HTML and PHP (similar to ASP and Cold Fusion) instead of having to rely on heavy amounts of code to output HTML. And, because PHP is executed on the server, the client cannot view the PHP code. PHP can perform any task that any CGI program can do, but its strength lies in its compatibility with many types of databases. Also, PHP can talk across networks using IMAP, SNMP, NNTP, POP3, or HTTP. PHP was created sometime in 1994 by Rasmus Lerdorf. During mid 1997, PHP development entered the hands of other contributors. Two of them, Zeev Suraski and Andi Gutmans, rewrote the parser from scratch to create PHP version 3 (PHP3).
