Check if the problem solver detects and solves all problems. If you have Windows 7 U 8, download the Microsoft Problem resolver. Then, double-click the downloaded file to run it. Select Windows Update and then Next. Delete the SoftwareDistribution software distribution folder is the folder where all Windows Update files are stored temporarily before installation. The modern install host is related to Windows Update and if these files are damaged, you may have problems, you need to delete the SoftwareDistribution folder toThe problem. Open the service console using Services.msc Scroll down and search for Windows Update, right-click and select Stop, now Open Explore Resources and Browse C: Windows SoftwareDaRediRedistribution Download Delete all files and folders within the download folder. To do this, use the shortcut from Windows + To keyboard to select everything and press the Super button. Now reopen the Windows service console and start the Windows Update service. Make sure that CPU usage is normal. Disable the Windows Update Service Needs Disable Guide, temporarily disable the Windows Update service as mentioned above, this program is connected to Windows Update and improvement. Therefore, if you have already installed the update and it is no longer necessary, you can temporarily turn off the Windows update and check if you resolve the problem. Press the Windows + R keyboard, type services.msc and click Accept this will open the Windows Services console, scroll down and locate the Windows Update service, right-click the Windows Update service selection properties, here it will change the boot type, Disable and then stop the service next to the status of the service, click Apply and OK to save the changes. Note: We recommend rehabilitating the Windows update service after a few days so that we can continue to receive security and performance updates. In addition, perform DISM restore the health/cleaning/restoring command and system file verification utility that helps repair the Windows system image and restore damaged system files that are missing with the correct one. This only solves the high use of the Windows 10 CPU, but also optimizes the performance of the Windows system. Read also: You will find different system apps and background processors when launce Windows Task Manager on your Windows 10 computer. Some of these processes, recognize. Others, not so much. If there is certain æModern Setup hostæ Cuning of the CPU of your PC in the Task Manager and wonder what it does, we highlighted everything you need to know about the system process in this explainer. As a cherry on top, you will also learn how to check if the modern installer is safe and how to reduce its high CPU usage on your computer. What is the modern configuration host The modern installation host is a main component of the Windows operating system. You will find it on any Windows computer, spective of the OS version or construction. Windows automatically downloads and installs the installation file of the modern installer (Setuphost.exe) on your computer. Of course, the process remainsin hibernation mode, almost as it does not exist. WHY, WHY,if you are installing a minor or major Windows update on your computer, the Modern Setup Host comes alive. The main function of Modern Setup Host is to prepare your computer to install Windows updates. During the installation process, you will find the Modern Setup Host running in the background. It is a critical component of Windows computer. Without the Modern Setup Host, you may not be able to upgrade your PC to the latest operating system. Similarly, you may encounter difficulties in upgrading your computer to Windows 10 from previous versions of Windows if Modern Setup Host is corrupt or malfunctioning. You will find the Modern Setup Host file in C:\\$ Windows.-BT\Sources folder on your computer's local disk. This is a self-initiating executable configuration file; you cannot start it manually unless there is a Windows update ready to install. Is the modern Host File setup secure? Microsoft is the developer of the Modern Setup Host file, so it is safe to have it on your computer. However, a virus or malware can disguise itself as the setuphost.exe file on your PC. Downloading the configuration file from unofficial sources or third-party websites puts you at risk of installing a modern virus-ridden configuration host on your computer. This could cause performance issues like high CPU usage, battery drainage issues, etc. But how do you determine if the setuphost.exe file on your computer is authentic (by Microsoft) or a virus that mirrors the Modern Setup Host file? Check the properties of the configuration file 1. Go to the folder (Local Disk (C:) > \$WINDOWS.-BT > Sources) containing the setuphost.exe file. Alternatively, type setuphost.exe in the Windows search box, right-click setuphost.exe on the result page and click Open File Location. 2. Right-click on the setuphost.exe file and select Properties from the shortcut menu. 3. Go to Details tab and check the setuphost Copyright belongs to æMicrosoft Corporation. 4. Also, go to the Digital Signatures tab and check if Microsoft Windows is in the Signatory Name column. These are indications that the setuphost.exe file on your PC is authentic and safe. However, if the Modern Setup Host continues to overuse CPU resources, you need to scan your PC for viruses and malware using an antivirus app. Refer to our comprehensive guide on removing stubborn malware on Windows 10 to learn more. Why Modern Setup Host Has High GPU Usage We have already established that Modern Setup Host helps to get your PC ready to install Windows updates. All things are the same, you should just take the setuphost.exe file about 15-30 minutes to complete this task. If process runs in hours and starts lifting the CPU load of your PC, it could be because: The hard drive has a slow writing speed; this can affect how fast updates are downloaded and installed on your computer. There are corrupt or conflicting temporary files on your PC. The Windows update process is blocked. There are numerous applications running in the background. 4 ways forModern configuration host issues The Windows 10 operating system has an integrated tool that automatically diagnoses and solves problems that prevent your computer from installing updates. This tool could also help solve problems that cause the malfunction of the Modern Setup Host. 1. Run Windows Update Troubleshoot Start Windows Settings and click Updates and Security. In the right sidebar, click Troubleshooting. Select Windows Update and click the Run troubleshooting button. If the troubleshooting of Windows Update detects an error that prevents your computer from installing an update, click Apply Fix to resolve the problem immediately. 2. Delete the SoftwareDistribution folder The SoftwareDistribution folder stores important files needed to install new updates on your computer. If this folder contains corrupt or conflicting temporary files, you may encounter difficulties in installing Windows updates. In addition, this could also cause the modern Host installation process to harden in the background, increasing CPU usage. To solve the problem, delete the content of the SoftwareDistribution folder and restart the computer. You don't have to worry about breaking something on your device. Windows will download the required files again. Follow the steps below to delete the content of the SoftwareDistribution folder. Launch the Windows Run prompt using the Windows+R keyboard shortcut. Successively, type softwareddistribution in the dialog box and click OK. Select all contents of the SoftwareDistribution folder and delete them. Better yet, back up the content in another folder on your computer. 3. Disable background apps When unnecessary apps are run in the background, they take control of CPU resources from vital system tasks. Disable as many unnecessary background applications as you can. This should reduce the CPU load of the computer and speed up the Windows Update process. Launch the Windows Settings menu and select Privacy. Scroll the App permissions section on the right sidebar and select App in the background. Look through background applications and turn off applications that you barely use. 4. Delete corrupt files Unforeseen interruptions (interruptions of internet or power, for example) during downloading and installing Windows Updates can cause a buildup of corrupt files. As a result, this could cause the Modern Setup Host process to remain stuck in the background and use high CPU resources. To solve this problem, use the tools of Deployment Image Servicing and(DISM) and system file control (SFC) To repair corrupt files preventing Windows upgrade. Type command prompt in the Windows search box and click Run as Admission Paste the underlying command in the console and press ENTER on the keyboard.Dism.exe / Online / CleanUp-Image / Scanhealth Wait for the computer scanning to scan the computer (ie when the progress bar reaches 100%) before proceeding at the next step. The underlying command in the console and press ENTER on the keyboard.Dism.exe / Online / Cleaning-Image / CheckHealthance. wait up to up to up Progress bar reaches 100% and proceed to the next step. Paste this command into the console and press Enter.DISM.exe /Online /CleanUp-image /Restorehealth Finally, paste the command below to run the System File Check tool.sfc /scannow Note: Each command may take several minutes (say 10 à 20 minutes) to complete. Do not close the Command Prompt window or stop the process. Reboot the computer when these commands have been successfully executed and see if this solves the problem of using the modern high-configuration CPU. Stay up to date. Stay safe You need the Modern Setup Host to keep your computer up to date. However, when a system process causes a high CPU usage, you should check that it is not a malware or a virus. Make sure the installation file is authentic and digitally signed by the official manufacturer. Scanning the file using an antivirus software (if you have one) may also help determine if it is safe or not. If none of the recommended solutions solve the use of a modern configuration high disk, you may need to restore your Windows PC. PC.
