First you need to disassemble the car. Remove it from unnecessary (old board, bulb and stuff) you need to leave the motors and the switch. Then, according to the scheme, you need to collect all the electronics and install it on the typewriter. After installing the electronics, you need to collect the car back. At the expense of the circuit, the bluetooth module is connected as follows: Rx - A1 Tx-A0 + 5V power, the motor shield is powered from + 7.2V PIBO ever sense, Inc. · Education Spanish English Dictionary Ascendo Inc. · Education Edpuzzle Edpuzzle · Education ABCmouse.com Age of Learning, Inc. · Education Learn Spanish Offline ufo studio · Education Solar Walk Lite · Planetarium 3D: Planets System Vito Technology · Education Pocket Physics Geckonization · Education Learn French Offline ufo studio · Education Learn Chinese - ChineseSkill ChineseSkill · Learn Chinese Mandarin APPs · Education Caesar Nicolas BERNE · Education I have just started with the youtube channel, so I decided to make a Bluetooth controlled robotic car. As an electronics engineer I have knowledge about electronics, but I don't know how to build a custom android application, so before making the project I learn about MIT app inventor and try to make one app which was a great success it is quite easy to do. In this article, we will learn how to make a custom Android application and how to configure the Bluetooth module with Arduino. Hardware requirements: Step 1: Building Chassis I used an acrylic sheet length of 18cm and width of 13cm. First, I positioned all parts that going to be mounted on the chassis, then I used a hot glue gun to stick the parts to acrylic you can use spacers or screws, after mounting all parts I stick the caster wheel at the bottom of the chassis. Step 2: Connection Make the connection according to the circuit diagram, we can use separate power for Arduino. Motor driver and 12v battery connected through the switch. As we can see in the circuit diagram there is 2.2k and 4.7 k resistor connected to the pins of the bluetooth module. The main reason for this is the HC-05 Bluetooth module uses a logic level of 3.3v. While transmitting data from HC-05 to Arduino there is no problem because Arduino is capable of receiving data from 3.3v logic, but while receiving any data from Arduino to HC-05 Arduino uses 5v logic which may damage our Bluetooth module, to convert 5v logic level to 3.3v we use a voltage divider method. Make sure that there is common ground between motor driver and Arduino otherwise motor not work. Step 3: Programming /\* Author:DIYelex date: 3/8/2019 \*/ #include <math>\langle math>
