# How to unlock locked android phone without losing data

How do you unlock a locked phone without losing data. How do i unlock my android phone without losing data. How to unlock locked phone without losing data.

Android: smartphones and apps are designed to be compelling, and for a lot of people (I included), it can hardly resist the shot of a Twitter notification or new photos on Instagram. There are many services to help you spend less time to fix your phone, but a free Android app takes a particularly brutal approach that could work for even more desperate smartphone drug addicts. Switching to me (identified by XDA-developers) offers some different features designed to curb the use of the phone. When I opened the app, the first thing I saw was two rows of large red buttons that offer to block my phone from 15 minutes to 3 hours. After selecting a 15-minute block, I started on the lock screen. I could answer calls, read notifications and use the camera, but it was so. (The paid version of the app lets you express the specific whitelist apps or completely lock the phone.) Lock me out can become granular. You can lock the phone up to a specific moment up to a specific moment, set it to automatically lock that day for an hour or two, or create a weekly blocking times program. Scroll to the end of the main app page, and you will also find an option that allows you to lock the phone for 30 minutes if the screen time passes 5 hours a day - or unlock the device more than 12-stroke in an hour . These techniques may seem a bit drastic, but if you can't stop to check your smartphone, lock myself an easy way to enforce short technological interruptions when you need it. Â© Adrees Latif / Reuters / Corbisif in the market for a new smartphone, you should ask you how simple (or taxation) that you will receive data from old to new will be. Upgrading from an older model for iPhone to iPhone 6? Easy jumping from Android to iOS or from iOS to Windows? You could lose key data if you're not attentive. This is four things that could disappear when changing mobile platforms and how to avoid such losses.1. Your media (photos, videos and music) There is no magic switch that you can flip that you migrate all your media from one platform to another, but it's not difficult to move these data yourself. How to save your data: You have two options. The first is to use the Storage based on Cloud.Steve Friedberg, President of MMI communications in Downingtown, Pennsylvania, has changed platforms twice in two years: first from the iPhone to Android and then again in Apple when he sparked the iPhone 6 Plus. The transition was almost perfect because Friedberg uses backup storage services such as Dropbox and SugarSync to keep your information and files in the cloud, the computer servers that host huge amounts of data, including the media of Friedberg. When you purchased a new phone, Friedberg has downloaded the storage app, signed on your account and has acquired access to all its saved files.Dropbox Basic accounts are free with 2 GB of storage space, even if You can earn up to 16 GB of additional space to complete your tasks like receiving friends to subscribe to an account. Drophox Pro takes you 1 terabyte (TB) storage Â€ ¤ - "That's" € s 1,000 GB Â€ ¤ - "for \$ 9.99 per month. The SugarSync basic package is equipped with 60 GB of storage space for \$ 74.99 a year. Your second option is to back up your phone's data on the PC or on the Mac. If you have iTunes uploaded to your computer, for example, you're already running your data backup. Making the transfer is just a matter of finding the folder where this information is located and loading it on the new phone. If you use a Mac and you're leaving or going to Android, here is the other thing In mind: you will have to download the transfer of Android files. Â free. PC users do not need additional software to connect to an Android device. If in the cloud or your computer, you need to back up your phone's data, even if you're not thinking about skipping the ship. In this way, those memories cannot be lost if you lose the phone.2. Your Appsome Friedberg thing lost in its second transition: your Swype keyboard app, which allows you to In a continuous movement without lifting your finger. It's the only app that paid on Android, so when he returned to iPhone, he paid \$ 0.99 to buy the iOS.Typically version, you will need to buy the apps when you move the platforms Â€ ¤ - "if you You paid apps first, say David Zimmerman, President of LC International technology in Clearwater, Florida, a data recovery company. How to save your data: For free apps, just download them on the new platform. Any information from the User is probably stored on the app-maker servers, so simply the login should give you full access to what you have had on your old phone. If you paid an app, Zimmerman says you can try to contact the developer and ask for a Free method to download the app on a different platform. Do not count on this operation, however .3. Your text messages are similar Many information on the phone, text messages are not easy to recover and sc AriCare, says Zimmmerman. This because while they were saved when hacking up the phone, their position is not always clearly labeled. How to save your data: If you need to keep only a few key texts, you have two simple options. The first is to take shots on the screen of important texts. Then they will be kept as a photo with all your other photos. The second is to copy the texts and then paste them into an e-mail to yourself or a text processing app that you know how to transfer your new phone. If you move it to have a lot of texts you want to save, Zimmerman suggests converting them into a file format that you can easily read somewhere in your phone. An Android phone, you can convert your messages into a text file that can be saved and read on your phone or computer through the free SMS app in text on Google Play.on an iPhone, this process is a bit Trickier.mossaggi are saved when you back up your phone, but the file in which you are clearly labeled, and there is not a text sms-free equivalent in the iTunes App Store. So you have to buy a service like iMazing (\$ 29.99) or follow the instructions on iPhone-SMS.com, which will accompany you on how to back up and recover your PC or Mac messages. This service is supported via iOS 7, according to the website.4. Do your contacts know more the phone number of anyone else? Probably not, which means that your contacts could be the most important data you would like to transfer. When you change platforms, you don't want to have to enter them again, especially on a tiny smartphone keyboard or screen. How to save them: If you have a Gmail account, it's easy. If you don't have one, registration for an e-mail account is also easy Â€ ¤ - "and free. If you have an iPhone and you're leaving the platform, connect the phone into your computer and open itunes. Under the card Â€ ¤ - "infoÂ€ ¤ - "control Â€ ¤ - "sync contacts" box. Select Â€ ¤ - "Sync Google Contacts, Â€ ¤ - "Give the email address you want to be synchronized and you did. When you get your new phone, you can synchronize the new phone with those contacts (Android TI ask when you turn on the phone if you want to synchronize your phone with a Google account) and your transfer is complete. If not leaving Android, you will essentially the same thing (even if there are many more types of Android phones Apple phones, then it may be different for your device). On the phone, open your contacts, press the menu, then Import / Export. You can then export this information to a Gmail account, which will allow you to synchronize that account on your new phone . Don't you have it every time you are safe at home, and there's no one else around to access your phone, yet you have Did you have to unlock, whenever you want to use it? Android 5.0 Lollipop Smart Block solve it. Many of you probably know the frustration, you are listening to something like Pandora or Spotify, and want to change the station, or give something down, or bookmark a song Â€ ¤ - "Whatever the case is the case, whenever you want to do this , you have to unlock yours Or, you just want to seem something (OK Google?) Or touch a quick text or any number of things you make one hundred times a day. It is even worse if you're jogging or otherwise engaged in a vigorous activity. Have you ever tried to unlock your phone when it is in one of those cases of protective exercise? Smart block mitigate a lot from that frustration allowing you to set trustworthy places, where you are up to a certain range, the phone or tablet won the block; Reliable devices, which will allow you to assign an intelligent block to bluetooth or coupled NFC devices; And finally, you can enable the trusted unlocking of the face, which means that you can simply turn on the device, look at it and unlocks, as long as your front camera is not obscured. Switching on to Smart Lock Smart Lock can be set by accessing the settings. Take down from the upper edge of your device as if you continue to control your notifications and tap the date gray / date of the date bar, then tap the gear Â€ ¤ - "SettingsÂ€ ¤ - "If you don't already have a block on your device, you should do it before setting the intelligent lock. We use a reason to unlock our device, but you can also use the PIN or Password option. Regardless of this, in the settings, it touches the options Â€ ¤ - "Security, Â€ - to Then Â€ ¤ - "Smart Block.Â€ - in the intelligent lock settings, we have three options: Trusted devices, trusted face and reliable places. You can have one, or others or all at the same time. Smart Lock will allow you to have all the trusted devices you want, but you can only configure a trusted face. The house is where you don't have to unlock your phone you can also have unlimited trusted places, which is really convenient, and what we want to concentrate before. When you touch Â€ ¤ - "Sustued Places, Â€ ¤ - "You can activate your home and workpositions assigned to Google Maps or add a personalized place. When you add a custom place, you will open to the current position , which can be added immediately or you can search for a position or address and add it. It is important to understand that this is heavily based on the Google location service, so if you got your GPS enabled, the personalized places will obviously be more Precise. Related: Google's position history is still recording your every move in the following screenshot, we can apparently choose the whole area of the San Antonio metro as a reliable place simply by touching the blue barÂ€ s below the map. Obviously, l' Idea is to add smaller areas that do not compromise the general safety of your device, such as a business or a specific address. Here, we have SC. ELTO to add our default domestic position, which we labeled as such. As you can see, you can quickly add a variety of personalized trusted places that frequent regularly. As soon as you interval in a reliable place, the intelligent lock is automatically engaged. Remember, can you also add your home and work Google Maps positions? To do this, you must first configure them in maps, sliding to the right from the edge of the left screen and touching Â€ ¤ - "Settings.Â€ - "Settings.Â€ - "On the settings pane, touch Â€ ¤ - "Home or work. Now you can enter your home and work addresses. Now you should be able to transform your work and the home address turned on and off in Smart Block by touching the small green button next to each. Setting e Using the Smart Block device If you want to add a trusted device a), for example via Bluetooth, you need to first mate in the Android Bluetooth settings. If you already have other coupled devices, you can touch Â€ ¤ - "Add the device trusted. Alla Next, tap Â€ ¤ - "Bluetooth Â€ - to add a previously coupled device. In this screenshot, we already have many other coupled devices, so we can add any, and whenever we connect to them, our intelligent block activates. Note, as you mating to Bluetooth devices, a notification will inform you that you can add it as a trusted device of a smart block. If you want to configure a smart lock, using NFC, it just taps another NFC enabled device or tag. Finally, Smart Lock gives Lollipop users a last Nifty feature, which is A more refined version of the Android face unlock feature from previous versions. Look at me when you want it to unlock! Adding a trusted face works very similar to the old face release function used to work only this is more seamless and is not intended to serve as a primary method to unlock your device. To add your face as a trusted face, touch the Â€ ¤ - "brollato" button in the Smart Lock settings. On the home screen, remember that Aren unlocks is safe as other unlocking methods, and someone who looks like Whether you can unlock your device. Touch Â€ ¤ - "Sediti up Â€ - "when you're ready. You want to set this where the light is right - nor too bright or too weak - and you must Hold the eye level device. When you are ready, click Â€ ¤ - "during the next phase, an orange-dotted contour will appear. Watch your device while keeping your face inside the points, which will become green as Android scans and stores your face. When it ends, click Â€ ¤ - "has not been done. If your device is not in a reliable place or connected to a trusted device, you will see the following icon at the bottom of the screen block. This means that the tablet or phone can be unlocked simply by looking at it. In case of success, the icon will change in an unlocked icon, which wakes away to open the device. Note, if you want to lock the device , Tap this unlock icon and change in a locked icon. You will not be able to unlock the device with your face, a reliable place or a trusted device. Instead, you will need to use your conventional unlocking method. If you can release it of the face does not work well for you in various lighting conditions, you can return to the intelligent lock settings, tap Â€ ¤ - "face of face" and you can improve the correspondence of your face or start again. Clearly, Smart Lock is one More cool security features that Android has achieved, and is long late. It is pretty nice to be able to use the phone or tablet in selected locations or with favorite devices and does not stop repeatedly during the day. Furthermore, the trusted face function works really well. In our tests, our Nexus 7 2013 had no problems with it, unlocking almost instantly when we turned on the device and watched it. If there is another inconvenience, it is that trusted places work only with positions based on Google Maps. Being able to use the home wifi access point would be a welcome addition, but for now you will still have to rely on third-party software. We hope that Google incorporates this feature into a future release. Have you still succeeded your hands on lollipop? If so, did you set Smart Lock? Let us know what you think so far to play in our discussion forum. We want to listen to your comments and answer your questions. Update: Originally mentioned that if you want to use SMART LOCK trusted places in Lollipop, you will need the version of Google Play Services. 6.5. Google is slowly pushing this update, but if you are impatient, you can download and spreading Google Play Services APK files.
