Read the following Customer Care and Technical Support information before installing the Carrier Hi WallSplit System. This information is intended to help you install and use the system properly and safely. It is not intended to replace the instructions that come with the system or the instructions that come with the components. For more information, contact your Carrier HVAC distributor or the Carrier Customer Care Center. See the back of this manual for contact information.

CAUTION

Do not attempt to install, service, or repair this system unless you are qualified and have been properly trained in the installation, service, and repair of air conditioning systems. Failure to follow the instructions in this manual could result in property damage, personal injury, or death.

1. Turn off the main electrical power to the system.

2. Remove the main electrical panel cover and disconnect the power to the system.

3. Disconnect the main electrical supply to the system.

4. Disconnect the main electrical supply to the system.

5. Disconnect the main electrical supply to the system.

6. Disconnect the main electrical supply to the system.

7. Disconnect the main electrical supply to the system.

8. Disconnect the main electrical supply to the system.

9. Disconnect the main electrical supply to the system.

10. Disconnect the main electrical supply to the system.

11. Disconnect the main electrical supply to the system.

12. Disconnect the main electrical supply to the system.

13. Disconnect the main electrical supply to the system.

14. Disconnect the main electrical supply to the system.

15. Disconnect the main electrical supply to the system.

WARNING

Do not touch the electrical components of the system. Failure to follow the instructions in this manual could result in electrical shock, personal injury, or death.

1. Do not touch the electrical components of the system.

Professional Login Products Inverter Hi WallSplit System Inverter Ducted Cassette Controllers Brochures Customer Support Installer and Technical Support Installer Manuals Service Manuals Fault Codes Parts Diagrams Spare Parts Blog About Contact The humble PC fan has been in active service for decades and remains the primary cooling method used in PCs to this day. Other methods exist, but are generally reserved for enthusiasts. Phase-change cooling is excellent but super expensive, and liquid cooling is all pumps, pipes, reservoirs, coupled with the ever-present fear of wet electronics. Misgivings about the age of the technology aside, it is difficult to deny the fact that blowing room-temperature air across heatsinks is an effective way to mitigate heat. Problems occur when systems aren't adequately set up to allow cool air to flow smoothly through a case, and air to be expelled before it can get too warm. This guide aims to help you maximize air flow through your case, thereby improving the performance, stability, and longevity of your precious PC components. Case layout Most PC cases today conform to the common ATX layout: optical drives at the front-top, hard disks in the front-middle, motherboard mounted on the right-side panel, PSU at the top-rear, and add-on cards mounted to exhaust out the rear of the case. There are a few variables to this design, some cases have removable side-mount hard disk caddies mounted in the bottom-front of the case allowing easier disk installation/removal and independent cooling from the optical bays. Others mount the PSU at the bottom of the case, rather than at the top to avoid hot air from the working components passing through it before being expelled. These variables shouldn't have any significant negative effects on air flow, but could change your cable management plans. More on that later. Fan positioning Fans are generally mounted in the following locations: front, rear, and side. Fans in the front of the case are usually primary shots, bringing ambient temperature air to pass through hot components. The upper and rear fans are exhaust gases, expelling the hot air out of the case and away from the internal components. In the past, this simple air exchange was sufficient, but in modern systems with video cards (and often multiple), large RAM banks and CPUs overclocked, you have to think more about how the air travels through a enclosure. General rules It can be tempting to buy a case that comes with as many fans as possible in the hope that it will cool your system better, but as you will see, the flow of efficient and soft air is demonstrably more important than a total flow of air higher in cubic feet per minute (CFM). The first step in any PC compilation is to buy a case of good quality that already comes with the fans you need, and none that you do not. The cases that use three vertically aligned fans in the front are a great place to start, as they draw in the air evenly across the entire front of the enclosure. That many intake fans probably contribute to the positive air pressure within the case, although (see the

advanced section at the end of this guide to the air pressure of the case). The rear and upper fans should be exhausted, expelling the air of the case). Don't buy a case that causes any obvious obstruction to airflow. For example, laterally mounted hard drive caddies are fantastic, but if they also require you to install discs vertically, they will obviously seriously hinder the flow of air. Consider spending extra on a modular PSU. Having the ability to remove superfluous cables makes a much cleaner system, and allows you easily cable for hardware purchased in the future. Do not install unnecessary hardware: Remove older PCI cards that are never used anymore, leave the additional RAM module fan kit in your packaging and consolidate small smallDiscs in a single bigger replacement. Please get rid of the floppy unit. Large internal fan ducts, while a *good* idea on paper, are more prone to reduce the general technical performance by obstructing the primary air flow through the case. Disassemble and eliminate them if possible. Fans mounted on the side of the case can be ostile, but often cause problems. If they are executing in a CFM too high, side fans can cause Heatsink fans mounted on ineffective life cards and CPUS. They can cause turbulence, hindering the efficient flow of air through a case, and can significantly contribute to dust accumulation. A fan if mounted to the side should be used to gently stir the hot air that can accumulate in the à € œThe dead under the PCIE and PCI cards. This is best using a large and low rpm rpm fan. Limpia your PC regularly! Dust accumulation is an important danger for electronic, since it is an insulator and can obstruct escape ports. It simply opens the case in a well -ventilated ame and uses a little compressed air or a soft brush to disassemble the accumulated dust. A vacuum can help collect dust before their lungs do it, but be careful not to get rid of any condenser of its components with him. Cleaning will be an important measure to take, at least until we are coolers that are de-polvore themselves. The most low and lower rpm fans are generally silent and more efficient than their small and most important counterparts. When possible, choose big. For the environment, do not execute its PC in any type of closed box. The desktop cubby holes seem increased convenient, but weigh that against inconvenience nu nu ne etnematerid CP us ratuceje etivE .ocurt le jArah etnemareneg otse .iortirce CP ed setropos sol ed oresat lenap le ratuq licjA se odunem A .rapisid etnellac eria le euq jArthmrep on euq ragul nAqLa ne olracoloc seconthe arap olAs .riurtsnoc CP us ed ocimr©Ài o±Aesid le ne otneimasnep le renop ne otnup ocop yaH .sodatnelacerbos setnenopmoc razalpmeer surface to reduce the accumulation of dust and fibers. Its climate will be a consideration in its cooling design. If you live in a particularly hot sprocket, you should think more about cooling your system, even considering more enclosed solutions, such as water cooling systems or phase change mentioned above. If you live in a more cold environment, ambient temperature air is more valuable and, therefore, it must be well used. If it is a smoker, it is strongly recommended that you do it away from your PC. Dust accumulation is already a danger to electronic, and cigarette smoke produces the worst type of dust thanks to moisture and chemical products with which it is mixed. It is very difficult to eliminate from the components, and causes them to fail much more than what they would. Do you think that sounds thirsty for blood? Well, one of the best parts of the game is that you can play with your friends, regardless of the platform they have, PC or game console, so prepare for some "friends." Photo courtes: @fortnitegame/twitter even if it is not With friends, it is easy to find a game to join, and the game is very addictive. If you gather resources, build structures and shoot your enemies is what you are looking for in a game, Fortnite is the game for you. League of Legends is one of the Battle Battle Arena (Moba) games in line with the players available for the PC. In this game, you must coordinate with your team partners to destroy the basis of the opposing team. Do not expect to dominate the complexities of this game at night to the map, but the action begins as soon as you click on the "Play" boton. Photo courties: @leagueoflegends/twitter The game rewarding careful and good teamwork and is always free, but if you want to keep your character after one week or add any characteristics and special improvements to your game, you will have than pay a rate. League of Legends uses a freemium model where the characters revolve weekly, and certain extras cost money. The game provides opportunities to win the game currency while playing, which you can then use to buy champions. Brawlhalla el "Brawl" in Brawlhalla, practically says everything for this fighting game that is similar to the popular Super Smash Bros. de Nintendo. Fights in competitions with up to four players, and the ultimate goal is to get your opponent from the sand to score points. Each character has its own weapons set for a game. Like League of Legends, Brawlhalla gets involved in a weekly rotation of playable characters, but you can always buy your favorites using the currency in the game you collect while playing. Screenrant gave this fighting game a "very good" qualification. Photo Cortesía: @ brawlhalla / Twitter Smite Smite is another popular Moba, this with his champions being gods of the ancient pantheons and classic myths. The matches take place among the teams of five that focus on destroying the bases and towers of their opponents. The game is played from a third person perspective, person,Fighting feels much more dynamic. Smite also presents a rotating list of free characters that can be purchased permanently with coin in the game or purchased in packages with real cash. PC Gamer rated Smite a 86 out of 100, with particularly high marks for its sand combat. Every year, new editions do not necessarily offer many new features compared to previous years, but tend to introduce game improvements as a better bargain and player response capacity. The game also continues to make an effort to perfect fanatic's favorite master league mode. Photo courties: @OfficialPes/Twitter Pro Evolution Soccer's "Lite" version is free and offers players access to the online mode of MyClub and PES Matchday, as well as playing in local and cooperative games and perfecting their skills in the Mode training. Some teams and stadiums are only available with the paid version of the game, but include fanatics' favorites such as FC Barcelona and Manchester United. More questions from .Net questions at once.
